Tragedy in Texas

Over the 4th of July weekend, tragedy struck in central Texas. As of the timing of this writing, the near historic flash flooding event has claimed over 120 lives with many still missing. While this area is known to have flash flooding, nobody was anticipating the Guadalupe River to rise an astonishing 26 feet in 45 minutes.

Unfortunately, the days following the tragic event were not much better as more severe storms continued to drop significant amounts of rain on an already devastated area. One can easily identify the parallels from this disaster to the Helene flooding that occurred in western North Carolina. The news of this disaster is littered with countless tales of heartbreak and heroism.

The Texas flooding and the Helene flooding bring a renewed appreciation to the forces of Mother Nature. It should remind everybody to verify and validate their preparedness levels, both professionally and personally. Unfortunately, flood warnings tend to be ignored or not taken seriously by many.

This easily be observed by the amount of people who get stranded in their vehicles when they attempt to drive through flood waters. Or worse, they are stranded in their homes or on their rooftops.

Tragedy in Texas (continued)

Photo credit: Jack Morgan / Texas Public Radio

Some may remember Texas A&M University Veterinary Emergency Team (TAMU VET) being deployed to Florida via Emergency Management Assistance Compact (EMAC) request after Hurricane Ian in 2022. During their deployment they assisted with veterinarian care of working canines for search and rescue operations. Once again TAMU VET was called to assist, but in their own state. During their 23-day deployment, the team cared for nearly 100 working canines for various afflictions ranging from heat stress to leg injuries. Those hardworking canines are credited with finding who were credited with finding 98% of the missing people.

LeiAnna Moorhead Presents Storms Preparedness to Florida's Agritourism Industry

Established in 2013 by dozens of agritourism industry members, the Florida Agritourism Association (FATA) is a state-wide organization that supports Florida's growing agritourism industry. FATA provides support by focusing on education, business development, marketing, and advocating for industry friendly legislation. This month our very own LeiAnna Moorhead presented an educational webinar to FATA on preparing farms for hurricanes and other emergencies. Topics covered were basic preparation tips, an overview of Emergency Support Function 17 (ESF17), and how resources are requested and mobilized during emergencies. The webinar was just under an hour long and the recorded presentation can be viewed on YouTube at [Storm Preparation for your Farm](#).

IMAGES OF RECOVERY

The **Images of Recovery Project** seeks photographers of all skill levels to contribute up to three photos depicting the recovery process in agricultural communities affected by recent hurricanes, aiming to identify needs and barriers and facilitate long-term recovery through Extension resources, with submitted photos showcased post-project via QR codes.

New World Screwworm

Story provided by the Florida Department of Agriculture and Consumer Services

New World screwworms are fly larvae (maggots) that can infest livestock and other warm-blooded animals, including people. They most often enter an animal through an open wound. They feed on the animal's living flesh and, if not treated, infestations can be fatal. While New World screwworm (*Cochliomyia hominivorax*) has not been widely present in the United States since the 1960s, it is still found in most of South America and in five Caribbean countries. Cases began spreading in 2023, heading north from Panama, and have reached southern Mexico, increasing the risk of reintroduction into the United States.

The New World Screwworm (NWS) has been spreading in Central America. While not currently detected in the U.S., NWS is a devastating pest and is being monitored.

What to know:

- NWS DOES NOT impact food safety.
- If **UNTREATED**, the NWS can impact livestock, pets, wildlife, and in rare cases, people.
- Be **PROACTIVE** to protect yourself and your animals.

How to keep you and your animals safe:

- NWS attacks open wounds.
- Be alert and **TREAT** wounds immediately.
- **MONITOR** wounds for infection.
- **CONTACT** your doctor or veterinarian if you suspect an infestation.

UF IFAS
UNIVERSITY of FLORIDA

If you want to learn more about
the New World Screwworm, visit
FDACS.gov/NWS

Signs

Screwworms are typically found on warm-blooded animals that have a draining or enlarging wound.

Screwworm eggs are creamy and white and deposited in a shingle-like manner on or near the edges of superficial wounds. The larvae are cylindrical with one pointed end and one blunt end and have rings of dark brown spines around the body. Female screwworm flies are larger than a housefly with a dark blue to blue-green body and reddish-orange head.

Almost any type of wound can become infested with screwworm larvae, including those caused by feeding ticks, castration, dehorning, branding, shearing, barbed wire fences, and even shedding of antler velvet in deer. The navels of newborn mammals can also become infested.

Guidance for Animal Health

Carefully inspect animal wounds and hides for signs of screwworm. Owners should immediately consult their veterinarian if a case of screwworm is suspected.

Continued, next page.

New World Screwworm (continued)

Story provided by the Florida Department of Agriculture and Consumer Services

Treatment

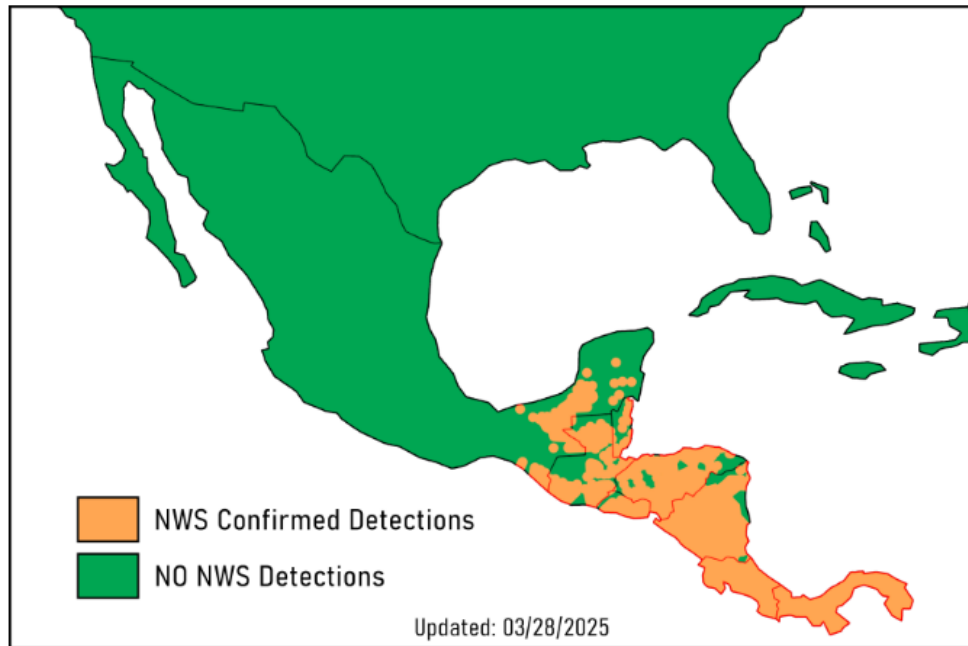

Screwworm infestation is treated by cleaning the site and topical application of a pesticide or other medication effective at killing the screwworm larvae. Treated wounds should be inspected daily until completely healed. The examining veterinarian will remove larvae from the wound with tweezers, place them in alcohol, and report to the Florida Department of Agriculture and Consumer Services' Division of Animal Industry (State Veterinarian's Office).

Report Suspected Cases

- **By phone during office hours:** (850) 410-0900
- **By phone after hours:** 1-800-342-5869
- **Via email:** RAD@FDACS.gov
- **Report online at:** www.FDACS.gov/RAD

Wildlife Reports

To report sick or injured wildlife, including a suspected screwworm infestation, call the Florida Fish and Wildlife Conservation Commission (FWC) at 1-888-404-FWCC (3922) or email the Wildlife Health Team at WildlifeHealthTeam@MyFWC.com.

New World Screwworm Webinar for Animal Industry

The New World screwworm (NWS), *Cochliomyia hominivorax*, is a devastating animal and public health pest. When NWS fly larvae burrow into the flesh of a living animal they cause serious, often deadly damage to the animal. NWS can infest livestock, pets, wildlife, occasionally birds, and in rare cases, people. Prior to successful eradication campaigns, NWS caused devastating losses in U.S. livestock through death, reduced productivity, and increased veterinary costs. During the 1976 NWS outbreak in Texas, producers spent an estimated \$132.1 million (or \$731.8 million in 2025 dollars) that year in response. Should NWS re-establish in the U.S., the economic consequences would be severe. For example, Texas alone could face losses exceeding \$700 million annually, with broader impacts on the state's economy reaching \$1.8 billion.

Webinar Objectives

By the end of this webinar, participants will be able to:

- Explain the NWS life cycle, clinical signs, and morbidity and mortality
- Summarize the current outbreak status of NWS infestations in Central America
- Describe how to report infestations
- Identify key interventions for eradication
- Locate specific support resources for responding to NWS

Webinar Topics

Webinar topics will include, but are not limited to:

- Biology/life cycle of NWS
- Distribution and current outbreak
- Recognizing infestations (clinical signs)
- Reporting infestations
- USDA actions and planned response
- Outreach materials

Florida EDEN: Mental Health Matters

Disasters shake more than just the physical foundations of our lives—they can take a significant emotional toll as well, according to the Florida Extension Disaster Education Network (EDEN). While the loss of property and disruption to daily life are often visible, the invisible impacts on mental health can be just as devastating. For Extension professionals, the responsibility of supporting communities through these events can bring added emotional strain, especially when navigating personal losses at the same time.

The educational materials below aim to equip you with practical strategies to strengthen personal resilience and better support those around you. Together we can foster healthier communities that are more prepared emotionally and physically before, during, and after disaster strikes.

Personal resilience plays a critical role in disaster response, especially for Extension professionals who serve on the front lines during crises like hurricanes. Resilience is the ability to reduce stress and adapt in challenging situations—anchored by three key attitudes: *challenge, commitment, and control*.

Research from UF/IFAS following Hurricane Irma showed that while many agents demonstrated strengths in learning and connecting with others, they also faced mental fatigue, stress, and unclear expectations—factors that impacted their ability to meet job demands. This educational resource outlines practical strategies for building resilience, including:

- Clarifying disaster response roles
- Offering targeted training
- Promoting support services and peer connection

By strengthening these skills and attitudes, Extension professionals can better balance personal and professional responsibilities and serve their communities more effectively in times of need.

Follow Florida EDEN on [Facebook](#), [Instagram](#), and [Twitter](#) to stay updated! Visit our [webpage](#) to learn more and access disaster preparedness resources.

The Florida Disaster Preparedness Guide for Animals and Agriculture

The [Florida Disaster Preparedness Guide for Animals and Agriculture](https://flsart.org/resource/DisasterPreparednessGuides/DisasterPreparednessGuides.jsp) was developed by FDACS and Florida SART. This guide explores the various animal and agricultural sectors in the state of Florida that are at risk from natural and man-made disasters, and what you can do to help prepare and protect animals and agriculture before a disaster strikes. The recommendations and resources in this guide are applicable to preparing for all hazards such as hurricanes, floods, wildfires, disease introduction, hazardous material spills, and more.

This publication is available only to SART members. To access the Florida Disaster Preparedness Guide for Animals and Agriculture, visit the SART website at flsart.org, and navigate to the "Resources" tab. It may also be accessed directly at:

<https://flsart.org/resource/DisasterPreparednessGuides/DisasterPreparednessGuides.jsp>

Become a Volunteer of the Florida Veterinary Corps Today!

Florida veterinarians and veterinary technicians have volunteered to assist local and state emergency management officials in responding to animal emergencies. The Florida Veterinary Corps is recruiting more volunteers to help protect our state.

Become A Volunteer

To apply to the Florida Veterinary Corps, visit www.FLSART.org

Safeguarding Animal and Public Health in Florida

A cooperative effort of the Florida State Agricultural Response Team and its Florida Department of Agriculture and Consumer Services, Florida Veterinary Medical Association, and University of Florida College of Veterinary Medicine.

Florida Veterinary Corps

What is the Florida Veterinary Corps?

- The Florida Veterinary Corps (The Corps) is a component of the Florida State Agricultural Response Team (SART), established within the Florida Department of Agriculture and Consumer Services and a cooperative effort with the Florida Veterinary Medical Association and the University of Florida, College of Veterinary Medicine.
- The Corps has been established to enlist veterinarians and veterinary technicians who are willing to volunteer their services in responding to animal emergencies in the state of Florida.
- During activation, Corps volunteers will work within an Incident Command System structure under state Emergency Support Function 17 as part of the State Emergency Response Team.
- Corps volunteers will be kept informed as to the status of emergencies and the need for volunteers depending upon the specific emergency.
- Volunteers may serve in veterinary infrastructure assessment teams, triage or emergency animal treatment teams, and animal disease surveillance or control teams under an Incident Command System structure.

Obligation of Corps Volunteers

- Corps volunteers will serve only when activated within an Incident Command System structure under state Emergency Support Function 17 as part of the State Emergency Response Team and adhere to all state regulations and rules.
- Complete the following four Incident Command System trainings to apply for The Corps. The Federal Emergency Management Agency (FEMA) provides the independent study courses online, free of charge. The training is required for credentialing of emergency responders by the Department of Homeland Security. The courses are critical to train a professional volunteer Corps capable of responding as part of the state Emergency Support Function 17 and State Emergency Response Team.
 - IS-100.C: Introduction to the Incident Command System (ICS)
 - IS-200.C: Basic ICS for Initial Response
 - IS-700.B: An Introduction to the National Incident Management System (NIMS)
 - IS-800.D: National Response Framework, An Introduction
- Corps volunteers will only be activated in response to specific emergency situations and may decline service at any time.

Rationale

- Protecting animal agriculture and household pets in Florida begins locally and requires cooperation, participation, and partnership.
- Federal or other outside assistance to deal with an animal disease emergency may not be available for hours or days.
- Animal agriculture in Florida is highly vulnerable to severe disruption and financial loss through natural disasters and exotic or zoonotic diseases.
- Counties and state agencies must be prepared to respond to animal disasters through planning and identification of human and material resources.
- Natural disasters are unpredictable and cannot be prevented.
- Florida has a high risk for introduction of a foreign animal disease.

Become a Volunteer

To apply to the Florida Veterinary Corps, visit www.FLSART.org

Be Sure to Check Out the FDACS and UF IFAS Partnership Video

Florida SART, FDACS, and University of Florida Institute of Food and Agricultural Sciences (UF/IFAS) teamed up to create a training video on their disaster response partnership.

Florida Department of
Agriculture and
Consumer Services

UF | IFAS
UNIVERSITY of FLORIDA

Published in December 2022 on [YouTube](#), the video features interviews with LeiAnna Moorhead (FDACS Emergency Programs Manager), Dr. Saqib Mukhtar (UF/IFAS Associate Dean for Extension, Agriculture, and Natural Resources), and Dr. Angie Lindsey [Extension Disaster Education Network (EDEN)].

EDEN is funded by the USDA and is a collaborative multi-state effort by cooperative extension services across the country to improve the delivery of services to citizens affected by disasters.

Dr. Lindsey highlighted the important connection that agricultural extension agents have throughout the State of Florida. "We learn so much from our Extension agents and the work that they're already doing throughout the state and the work that they do within their own communities for disaster preparedness, recovery, and response," said Dr. Lindsey.

Counties, is your contact information up to date on the SART website?

Please review your county emergency contact information at:
<https://flsart.org/resource/countyinformation.jsp>.

If you need to make changes to your county contact information, please send a request to LeiAnna Moorhead at LeiAnna.Moorhead@FDACS.gov. During an emergency, ESF 17 and SART provides necessary food and water to affected areas to help protect animals, agriculture, and pets.

CALENDAR OF EVENTS

Small Animal Emergency Sheltering Training

Florida State Animal Response Coalition (FLSARC) provides Small Animal Emergency Sheltering training for Florida communities. These courses teach the unique procedures, skills, and knowledge necessary to build and operate a temporary emergency animal shelter in response to natural disasters and animal cruelty cases. These courses were created and designed by experts from many organizations including Florida SART, University of Florida Veterinary Emergency Treatment Service (VETS) Team, and leadership of FLSARC. This training is state-certified by the Florida Division of Emergency Management.

Animal Rescue from Sewers and Storm Drains

In August 2023, three Floridians tragically lost their lives after entering a Texas cistern in an attempt to rescue a dog. The animal had fallen eight feet into water below ground. All three individuals succumbed to hydrogen sulfide gas exposure — a silent, deadly hazard. This incident is a sobering reminder of the risks associated with rescuing animals from confined spaces such as storm drains, sewers, and culverts.

These environments can accumulate toxic or flammable gases from fertilizers, fuel spills, or nearby pipelines. While local animal rescues involving ducklings or kittens are often successful and heartwarming, responders must not overlook the hidden dangers. According to OSHA, confined spaces are not meant for regular human occupancy, often contain limited entry and exit, and may require special permits if atmospheric or structural hazards are present. The National Institute for Occupational Safety and Health (NIOSH) reports that over 60% of confined space fatalities are would-be rescuers, underscoring the need for caution and training.

For SART partners, the takeaway is clear: if the rescue scene resembles a confined space, it should be approached as a technical rescue. The safest strategy often involves avoiding entry altogether. Tools such as nets or baited traps can enable animal retrieval from a distance. When entry is unavoidable, specialized response teams should be contacted. Fire departments may assist with forced-air ventilation, while hazmat units can monitor air quality for oxygen, toxicity, and flammability. If conditions demand it, rescuers must wear appropriate respiratory protection.

Animals in distress may act defensively, creating risk for bites, scratches, and potential disease exposure. Safety protocols should minimize direct contact until the animal is secure and calm. After rescue, decontamination is critical — a lathering with Dawn dish soap and thorough rinse can remove most surface contaminants. Rescuers should wear personal protective equipment during this process to avoid contact with pathogens like hepatitis or harmful bacteria.

Community education on the risks of confined spaces is vital. Public safety professionals and SART partners must prioritize responder safety alongside animal welfare. Those interested in learning more about safe animal rescue techniques are encouraged to explore training opportunities at: <https://responseteam.vetmed.ufl.edu>

This program is funded through USDA APHIS NADPRP

SUMMER 2025

PRODUCER DECON

CERTIFICATE TRAINING PROGRAM

Educating producers on how to utilize decontamination best practices to prepare their farms and staff for implementing prevention and response activities during a foreign animal disease outbreak.

This Program Provides Producers with Knowledge to:

**Understand
Disease Threats &
Government
Collaboration**

**Perform a
Premises
Assessment & Site
Decon Plan**

**Protect their
Livelihood &
Implement Routine
Biosecurity Practices**

Those eligible to enroll in the program include but are not limited to:

U.S. small and large-scale livestock and poultry producers, food animal and agriculture affiliates, industry site managers, extension agents and ag educators, animal feed industry personnel, and other professionals in food animal and livestock production fields.

Did You Know? SART Offers Pet-Friendly Sheltering Online Training

The Pet-Friendly Sheltering Online Training is the first of its kind to be offered in Florida. The Training gives guidance to private, local, and state entities on how to plan for and operate a pet-friendly shelter to ensure that individuals evacuating from a disaster with their household pets are accommodated.

This training includes useful information on how to:

- Use the Incident Command System in pet-friendly shelter planning and operations;
- Plan for a pet-friendly shelter;
- Understand the Pets Evacuation and Transportation Standards Act (PETS Act);
- Establish partnerships for resource coordination;
- Deliver a unified message for resource coordination;
- Deliver a unified message to the public before, during, and after an emergency, and;
- Set up, operate, and demobilize a pet-friendly shelter.

Laura Bevan

Humane Society of the United States

"I was blown away by the depth of the information provided in this training. It held my attention and the videos from around the state gave real life experience to the subject."

The four-hour course is designed for emergency managers, county employees, veterinary and animal services, and shelter volunteers. There is no charge for this 100% online course. For more information, please visit www.FLSART.org.

Food Safety and Food Defense Report

A special section dedicated to feed and food emergency planning and response.

FDACS Division of Food Safety is responsible for assuring the public of a safe, wholesome, and properly represented food supply through permitting and inspection of food establishments, inspection of food products, and performance of specialized laboratory analysis on a variety of food products sold or produced in the state. The Division of Food Safety monitors food from the farm gate, through processing and distribution, to the retail point of purchase.

Water Needs for Power Outages

**Prepare for storms and power outages by having enough water.
Buy bottled water for drinking and fill jugs or other containers with
water for cooking and bathing.**

How much water does one person or pet need?

Each person and pet should have at least one gallon of water each day.

One day = One gallon

One week = Seven gallons
