Training Slides Appendix A
About Florida SART

- SART is a multi-agency coordination group.
- SART is made up of over 25 partner agencies (state, federal and non-governmental organizations).
- SART provides preparedness and response resources for Emergency Support Function 17 [(ESF 17) Animal and Agricultural Issues].
- SART statutory authority
  - State Emergency Management Act (Section 252.3569, Florida Statutes)

SART Mission

Empower Floridians through training and resource coordination to enhance all-hazard disaster planning and response for animal and agricultural issues.

SART Goals

- Support the county, regional and state emergency management efforts and incident management teams.
- Identify county resources available for animal and/or agricultural issues.
- Promote the cooperation and exchange of information of interested state, county and civic agencies.
Specific Learning Objectives

At the end of this training module, participants will be able to:

- Define foreign animal disease
- Explain how foreign animal diseases (FADs) are introduced
- Explain consequences of FAD introduction
- Name and provide details of nine specific FADs
- Describe the difficulty in diagnosing foreign animal diseases and how diagnosis is confirmed
- Explain how to prevent disease spread and introduction
- Identify key resources that participants can easily access for more information
Resources

The following are sources of additional information about the subjects mentioned in this introduction.

Florida Department of Agriculture and Consumer Services

The authors wish to express their appreciation to the various agencies and individuals that have supplied images for this presentation.

Appendix A: Slides 1-3
Learning Objectives

• Define foreign animal disease
• Explain how foreign animal diseases (FADs) are introduced
• Explain consequences of FAD introduction
• Name and provide details of nine specific FADs
• Describe the difficulty in diagnosing foreign animal diseases and how diagnosis is confirmed
• Explain how to prevent disease spread and introduction
• Identify key resources that participants can easily access for more information

What is a FAD?

A foreign animal disease, or FAD, is:
• An exotic, important, transmissible livestock or poultry disease
• Believed to be absent from the United States and its territories
• Has potential to cause significant health or economic impact, should it be introduced

OIE List of Reportable Diseases

• The World Organization for Animal Health, or OIE*, maintains a list of reportable diseases
• Diseases listed by OIE are considered the greatest threats to animals and livestock worldwide
• More information on these diseases is available on the OIE Wb site <www.oie.int>

*The organization was previously called Office International des Epizooties.
What is reportable?

- Transmissible diseases with potential for very serious and rapid spread, irrespective of national borders, that are of serious socio-economic or public health consequence and that are of major importance in the international trade of animals and animal products.
- Reports are submitted to the OIE as often as necessary to comply with the International Animal Health Code. Reports are submitted by national delegate. In the US, this is USDA-APHIS International Services.
- During outbreaks, several reports can be filed each day.

Multiple Species Diseases

- Anthrax
- Aujeszky's disease
- Bluetongue
- Brucellosis (Brucella abortus)
- Brucellosis (Brucella melitensis)
- Brucellosis (Brucella suis)
- Crimean Congo hemorrhagic fever
- Echinococcosis/hydatidosis
- Foot and mouth disease
- Heartwater
- Japanese encephalitis
- New world screwworm (Cochliomyia hominivorax)
- Old world screwworm (Chrysomya bezziana)
- Paratuberculosis
- Q fever
- Rabies
- Rift Valley fever
- Rinderpest
- Trichinellosis
- Tularemia
- Vesicular stomatitis
- West Nile fever

Some Reportable Mammalian Diseases

Cattle diseases
- Bovine anaplasmosis
- Bovine babesiosis
- Bovine genital campylobacteriosis
- Bovine spongiform encephalopathy

Equine diseases
- African horse sickness
- Contagious equine metritis
- Equine encephalomyelitis (Eastern and Western)

Swine diseases
- African swine fever
- Classical swine fever
- Nipah virus encephalitis

Sheep and goat diseases
- Caprine arthritis-encephalitis
- Contagious agalactia
- Contagious caprine pleuropneumonia

Lagomorph diseases
- Myxomatosis
- Rabbit haemorrhagic disease
Some Reportable Non-Mammalian Diseases

**Bird diseases**
- Avian chlamydiosis
- Avian infectious bronchitis
- Avian infectious laryngotracheitis
- Avian mycoplasmosis
- Duck virus hepatitis

**Fish diseases**
- Epizootic haematopoietic necrosis
- Spring viremia of carp
- Viral haemorrhagic septicemia

**Mollusc diseases**
- Bonamia ostreae
- Martellia refringens
- Mikrocytos mackini

**Bee diseases**
- Acarapisosis of honey bees
- American foulbrood of honey bees
- Small hive beetle infestation
- Varroosis of honey bees

**Consequences of Introduction**
- Could devastate livestock or poultry populations through high morbidity or mortality
- Other countries ban import of animals and related animal products to protect their agriculture industry
- Millions, possibly billions, of dollars spent to control or eradicate the disease
  - 2002–2003 Newcastle Disease outbreak in CA, NV, TX and AZ
    - 932 farms identified as infected
    - Taxpayer cost $168-milion for eradication
- Spread of disease into a susceptible wildlife population could complicate or prevent disease eradication

**How are FADs introduced?**
Florida’s vast and diverse agricultural system is susceptible to many FADs due to:
- Geographical location
- Climate
- Numerous ports of entry
- Legal importation of animals for trade
- Smuggling of animals
- International travel by people
- International travel by pets
- Wildlife movement and migration
- Animal products
- Bioterrorism or other malicious introduction
Exotic reptiles such as this tortoise may harbor vectors of a FAD or be carriers of a FAD themselves. For 20 years, many outbreaks of Newcastle disease have been caused by psittacine birds illegally imported into the U.S. Orlando International Airport saw over 44.6 million passengers in 2017, including over 5.8 million internationals.

The migratory flight path of these cattle egrets is often directly through Florida. Dogs can also carry ticks or other parasites that could introduce a FAD when they travel with their owners. People can intentionally release diseases or agents of disease.

Recognition of Specific Diseases

Foot and Mouth Disease
- Heartwater
- African Horse Sickness
- Venezuelan Equine Encephalomyelitis
- Rift Valley Fever
- Exotic Newcastle Disease
- Highly Pathogenic Avian Influenza
- African Swine Fever
- Classical Swine Fever
Foot and Mouth Disease

- Highly contagious viral disease
- Important economic losses
- Low mortality rate in adults
- High mortality often in young animals due to myocarditis
- Incubation period 2–14 days
- Recovery often in 8–15 days
- Endemic to parts of Asia, Africa, the Middle East and South America

Classical presentation of a cow afflicted with FMD is excessive salivation and licking of the lips.

Foot and Mouth Disease

Hosts

- Cattle
- Zebu
- Domestic buffalo
- Yaks
- Sheep
- Goats
- Swine
- All wild ruminants and swine
- Camels, llamas, and other Camelidae species have lower susceptibility

In endemic areas, multiple species of both domestic and wild animals can be susceptible to FMD.

Foot and Mouth Disease

Transmission and Sources

Transmission by direct or indirect contact with breath, saliva, feces and urine
- Milk and semen can transmit disease up to 4 days before clinical signs
- Animate and inanimate objects (fomites) can be vectors
- Airborne transmission of infectious droplets can occur 35 miles over land or 185 miles over sea

Sources of virus
- Incubating and clinically affected animals
- Meat and by-products in which pH has remained above 6.0
- Carriers
  - Particularly cattle and water buffalo, convalescent animals and exposed vaccinates
  - In Africa, the Cape buffalo is the major maintenance host
On-Farm Disease Recognition

Cattle
- High temperature
- Lack of appetite
- Shivering
- Reduced milk production for 2–3 days
- Smacking of the lips
- Teeth grinding
- Drooling
- Lameness
- Stomping or kicking
- Vesicles (blisters) in mouth and nose, between hooves, at coronary band – Rupture typically after 24 hours

Foot and Mouth Disease

Recognizing FMD in Cattle

This cow has visible blister ruptures on the nose and signs of drooling

Over time, healing of ruptured vesicles is obvious

Appendix A: Slides 19-21
Recognizing FMD in Sheep and Goats

- Vesicles less pronounced, easier to miss
  - On dental pad and feet in sheep
- Agalactia in milking sheep and goats
- Death in young stock

Mucosal disease
Infectious bovine rhinotracheitis
Bluetongue
Bovine mammitis
Bovine papular stomatitis
Bovine viral diarrhea

Recognizing FMD in Swine

- Swine housed on concrete can develop severe foot vesicles as a result of FMD
- Frequently see high mortality in piglets
Recognition of Specific Diseases

Foot and Mouth Disease

Heartwater

African Horse Sickness

Venezuelan Equine Encephalomyelitis

Rift Valley Fever

Exotic Newcastle Disease

Highly Pathogenic Avian Influenza

African Swine Fever

Classical Swine Fever

Heartwater

• Also known as Cowdriosis
• Rickettsial disease of ruminants
• Caused by a bacteria, *Ehrlichia ruminantium* (formerly *Cowdria ruminantium*)
• Occurs in nearly all sub-Saharan African countries, Madagascar and some islands in the Caribbean
• Concern for Florida exists because
  – Native tick vectors
  – Migratory bird paths between Florida and Caribbean
  – Indigenous and exotic reptiles can be reservoir hosts
  – Large, susceptible deer population

On-Farm Disease Recognition

Primary vectors: *Amblyomma* ticks

• Larvae and nymphs pick up *E. ruminantium* while feeding
• Adults transmit disease to susceptible animals

Hosts

• Domestic cattle, sheep and goats: *Bos indicus* breeds typically have less severe disease than *Bos taurus* breeds
• Wild ruminants like eland, springbok, blesbok and black wildebeest

Other wild animals act as vector hosts and disease carriers, e.g., helmeted guinea fowl, leopard tortoise, scrub hare

Ticks of varying sizes and at varying stages within their life cycles play an important role in the transmission of Heartwater and other diseases
Heartwater

On-Farm Disease Recognition

• Body temperature suddenly rises to more than 106°F within 1-2 days, fluctuates, then drops before death
• Lack of appetite
• Listlessness
• Respiratory distress
• Diarrhea common in cattle
  – Not common in small ruminants
• Subacute Heartwater with less pronounced signs, and peracute Heartwater with sudden death, can also occur
  – Depends on ruminant breed and *Ehrlichia* strain

Heartwater

Signs of Nervous System Impairment

• Walk in circles
• Make sucking movements
• Stand rigidly with tremors of superficial muscles
• Cattle may push head against wall, act aggressive or anxious
• Animal falls to ground, pedal, exhibits opisthotonos (arching), nystagmus (eye movements), and chewing movements
  – Usually die during or after this nervous attack

Heartwater

Diseases with Similar Symptoms

• Rabies
• Bacterial meningitis and encephalitis
• Chlamydiosis
• Toxic plants
• Mycotoxin exposure
• Heavy metal toxicity
• Pulpy kidney disease and Bluetongue in sheep

Appendix A: Slides 28-30
Recognition of Specific Diseases

Foot and Mouth Disease
Heartwater

**African Horse Sickness**
Venezuelan Equine Encephalomyelitis
Rift Valley Fever
Exotic Newcastle Disease
Highly Pathogenic Avian Influenza
African Swine Fever
Classical Swine Fever

State Agricultural Response Team

---

**African Horse Sickness**

Mortality rates
- Horses 70–95%
- Mules ~50%
- Donkeys ~10%

Usual hosts are horses, mules, donkeys and zebra
- Occasionally elephants, camels and dogs (after eating infected blood or horsemeat) may become hosts

Zebra believed to be reservoir host

Incubation period
- Usually 7–14 days, but can be as short as 2 days

State Agricultural Response Team

---

**African Horse Sickness**

Transmission and Sources

Not directly contagious
Requires a biological vector
- Midge and mosquitoes
  - Culicoides, Culex, Anopheles and Aedes spp.
- Ticks (occasionally)
  - Hyalomma and Rhipicephalus spp.

Virus sources
- Viscera and blood of infected horses
Viremia (virus in blood stream)
- Horses: up to 18 days, often 4–8 days
- Zebra and donkeys: up to 28 days

State Agricultural Response Team

---
### African Horse Sickness

#### On-Farm Disease Recognition

**Subclinical form**
- Fever (104–104.9°F)
- General malaise for 1–2 days

**Subacute or cardiac form**
- Fever (102–105.8°F)
- Swelling of eyelids and above, facial tissues, neck, thorax, brisket and/or shoulders
- Death usually within one week

**Acute respiratory form**
- Fever (104–105.8°F)
- Difficulty breathing (dyspnea)
- Spasmodic coughing
- Dilated nostrils with frothy fluid oozing out
- Redness of conjunctiva
- Death within one week

**Mixed form (cardiac and respiratory)** occurs frequently
- Pulmonary signs of a mild nature that do not progress
- Edematous swellings and effusions
- Death from cardiac failure usually in one week

**Nervous form** is rare

#### Diseases with Similar Symptoms
- Anthrax
- Equine infectious anemia
- Equine viral arteritis
- Trypanosomosis
- Equine encephalosis
- Piroplasmosis
- Purpura hemorrhagica

---

On-Farm Disease Recognition

Diseases with Similar Symptoms

---

Appendix A: Slides 34-36
Recognition of Specific Diseases

Foot and Mouth Disease
Heartwater
African Horse Sickness

**Venezuelan Equine Encephalomyelitis**

Rift Valley Fever
Exotic Newcastle Disease
Highly Pathogenic Avian Influenza
African Swine Fever
Classical Swine Fever

State Agricultural Response Team

---

**Venezuelan Equine Encephalomyelitis**

- Mosquito-borne virus
- Similar to Eastern and Western Equine Encephalomyelitis (EEE and WEE)
  - Similar clinical signs
  - Ultimately fatal in many cases
- Endemic in Central and northern South America
- Last reported U.S. outbreak in 1971
  - Lower virulence strains endemic to southern Florida

State Agricultural Response Team

---

**Venezuelan Equine Encephalomyelitis**

**Hosts and Sources**

**Hosts**
- Rodents, birds, humans and horses (VEE, EEE, WEE can infect all)
- Bats, reptiles, and amphibians (EEE)
- Bats and marsupials (VEE)
- Humans are dead-end hosts for VEE, EEE, WEE
- Cattle, swine and dogs can be infected, often do not show signs of illness and do not spread the disease

**Virus sources**
- Blood of VEE infected horses
- Rodent-mosquito infection cycle
- Bird-mosquito infection cycle for EEE and WEE

**Incubation period**
- VEE: 2–6 days
- EEE and WEE: 5–15 days

State Agricultural Response Team

---

Appendix A: Slides 37-39
Transmission and Subtypes

Transmission
- VEE virus transmitted by mosquitoes that had blood meal from animal with sufficient blood levels of virus (viremia)
  - Subsequent feeding on animals transmits virus via mosquito saliva

Subtypes
- Endemic
  - Disease endemic to a specific area
  - Associated with rodent-mosquito transmission cycle
  - Can cause human illness, but not affect equine health
- Epidemic
  - Spread rapidly through large populations
  - Highly pathogenic to humans and horses
  - Horses are primary reservoir (not true for EEE and WEE)

On-Farm Disease Recognition

- Mild, vague signs of fever, lack of appetite, depression
- Increased or decreased response to external stimuli
- Unusual behavior
- Appear blind and ataxic, or walk in small circles with progressive lose of motor control
- Nervous signs may progress until collapse with violent and uncontrolled movements of limbs, head, mouth and eyes
- Death without preceding signs is possible
- Humans typically have headaches, fever and other flu-like symptoms

Diseases with Similar Symptoms

- West Nile Virus
- Eastern Equine Encephalomyelitis
- Western Equine Encephalomyelitis (and related viruses)
- Equine Herpes Virus 1 Encephalomyelitis
- African Horse Sickness
- Rabies
- Toxins
- Botulism
- Trauma
Recognition of Specific Diseases

Foot and Mouth Disease
Heartwater
African Horse Sickness
Venezuelan Equine Encephalomyelitis

Rift Valley Fever
Exotic Newcastle Disease
Highly Pathogenic Avian Influenza
African Swine Fever
Classical Swine Fever

Rift Valley Fever

- Acute hepatic and hemorrhagic disease
- Caused by mosquito-borne virus
- Affects domestic ruminants and humans
- Very high mortality rate in young animals
- High abortion rate in ruminants
- Hosts
  - Cattle, sheep, goats
  - Dromedaries
  - Several rodents
  - Wild ruminants, buffaloes, antelopes, wildebeest, etc.
  - Humans very susceptible
  - African monkeys and domestic carnivores present a transitory viremia

Transmission and Sources

- Mosquitoes of many genera are effective biological vectors
  - Aedes, Anopheles, Culex, Eretmapodites, Mansonia, etc.
  - Aedes mosquitoes are reservoir hosts
- Direct contamination can occur in humans when handling infected animals and meat
- Incubation period ranges from 1–6 days
- Recognized exclusively in African countries; enhanced by high rainfall and dense populations of vector mosquitoes
- Sources of virus...
  - For animals: Wild fauna and vectors
    - Nasal discharge
    - Blood and vaginal secretions after abortion in animals
    - Mosquitoes
    - Infected meat
  - Possibly aerosols and consumption of raw milk

Appendix A: Slides 43-45

**Adult Cattle**

- Fever (104–105.8°F)
- Excessive salivation
- Lack of appetite
- Weakness
- Fetid diarrhea
- Jaundice
- Drop in milk production
- Abortion may reach 85% in the herd
- Mortality rate usually <10%
- Inapparent infections quite frequent

**Calves**

- Fever (104–105.8°F)
- Depression
- Jaundice
- Mortality rate 10–70%

**Adult sheep, goats and swine**

- Fever (104–105.8°F)
- Increased respiratory rate
- Bloody, mucopurulent nasal discharge
- Vomiting
- In pregnant ewes, abortion may reach 100%
- Inapparent infections in goats and swine quite frequent

**Lambs have different signs from adult sheep**

- Fever (104–107.6°F)
- Increased respiratory rate
- Lack of appetite
- Weakness
- Death within 36 hours after inoculation
- Mortality rate: Under 1 week of age: up to 90%
  Over 1 week of age: up to 20%

**Influenza-like syndrome in humans**

- Fever (100–104°F)
- Headache
- Muscular pain
- Weakness
- Nausea
- Epigastric discomfort
- Photophobia

**Inapparent infection quite frequent**

**Recovery occurs within 4–7 days**

---

Appendix A: Slides 46-48
### Diseases with Similar Symptoms

- Bluetongue
- Wesselsbron disease
- Enterotoxemia of sheep
- Ephemeral fever
- Brucellosis
- Vibriosis
- Trichomonosis
- Nairobi sheep disease
- Heartwater
- Ovine enzootic abortion
- Toxic plants
- Bacterial septicemias

### Recognition of Specific Diseases

**Foot and Mouth Disease**

**Heartwater**

**African Horse Sickness**

**Venezuelan Equine Encephalomyelitis**

**Rift Valley Fever**

**Exotic Newcastle Disease**

**Highly Pathogenic Avian Influenza**

**African Swine Fever**

**Classical Swine Fever**

### Exotic Newcastle Disease

- Highly contagious avian disease producing severe neurologic and gastrointestinal signs in poultry
- High mortality rates possible
- Not endemic to U.S., but outbreaks occur due to illegal importation of exotic birds
- Economic losses can be significant
- Mortality and morbidity rates vary among host species and with strains of virus
- Sources of virus
  - Respiratory discharges, feces and other bodily secretions
  - All parts of carcass

Appendix A: Slides 49-51
Exotic Newcastle Disease

Hosts and Transmission

**Hosts**
- Many species of birds, both domestic and wild
- Chickens are the most susceptible poultry
- Ducks and geese are the least susceptible poultry
- A carrier state may exist in psittacine and some other wild birds

**Transmission** by direct contact with feces and other secretions from infected birds
- Virus shed during the incubation period, convalescence
  - Some psittacine birds shed END virus off and on for >1 year
- Virus persists in the environment
  - Infection can be spread by Contaminated feed, Water, Implements, Premises, Human clothing, etc.

Incubation period is 4–6 days

---

Exotic Newcastle Disease

On-Farm Disease Recognition

- Gasping and coughing are common respiratory signs
- Nervous system signs include
  - Drooping wings
  - Dragging legs
  - Twisting of the head and neck
  - Circling
  - Depression
  - Lack of appetite
  - Complete paralysis
- Partial or complete cessation of egg production with misshapen, rough or thin-shelled eggs that contain watery albumen
- Greenish watery diarrhea
- Swelling of the tissues around the eyes and in the neck

---

Exotic Newcastle Disease

On-Farm Disease Recognition

Example of profuse respiratory discharge that may be present with END in chickens

Eyelids and conjunctiva are swollen, edematous and inflamed
Exotic Newcastle Disease

Diseases with Similar Symptoms

- Fowl cholera
- Avian influenza
- Laryngotracheitis
- Fowl pox (diphtheritic form)
- Psittacosis (chlamydiosis in psittacine birds)
- Mycoplasmosis
- Infectious bronchitis
- Pacheco’s parrot disease (psittacine birds)
- Management errors such as deprivation of water, air, and/or feed

Recognition of Specific Diseases

Foot and Mouth Disease
Heartwater
African Horse Sickness
Venezuelan Equine Encephalomyelitis
Rift Valley Fever
Exotic Newcastle Disease

**Highly Pathogenic Avian Influenza**

African Swine Fever
Classical Swine Fever

Highly Pathogenic Avian Influenza

- Capable of producing disease in many species of animals, including humans
- Ability for genetic shift
  - Difficulty to develop vaccine
- High mortality rate and extremely contagious
- Recent U.S. outbreaks have been different strains than the 2004 Asian epidemic
  - Lower pathogenic strains may have ability to mutate and become highly pathogenic
Hosts and Sources

Hosts
- Assume all avian species are susceptible to infection
- Highly pathogenic avian influenza isolates obtained primarily from chickens and turkeys
- Pigs considered as "mixing vessel" for influenza viruses and should be considered when examining any influenza outbreak

Sources of virus
- Feces and respiratory secretions
- Highly pathogenic viruses may remain viable for long periods of time in infected feces, but also in tissues and water

Transmission and Incubation

Transmission
- Direct contact with secretions from infected birds, especially feces
- Contaminated feed, water, equipment and clothing
- Clinically normal waterfowl and sea birds may introduce the virus into flocks
- Broken, contaminated eggs may infect chicks in the incubator

Incubation period is 3–5 days

On-Farm Disease Recognition

- Severe depression
- Lack of appetite
- Nasal and oral cavity discharge
- Drastic decline in egg production
- Facial edema with swollen and cyanotic combs and wattles
- Petechial hemorrhages on internal membrane surfaces
- Sudden deaths (mortality can reach 100%)

The comb and wattle on this chicken are swollen and cyanotic
Diseases with Similar Symptoms

- Acute fowl cholera
- Velogenic Newcastle disease
- Respiratory diseases, especially infectious laryngotracheitis

Recognition of Specific Diseases

Foot and Mouth Disease
Heartwater
African Horse Sickness
Venezuelan Equine Encephalomyelitis
Rift Valley Fever
Exotic Newcastle Disease
Highly Pathogenic Avian Influenza

**African Swine Fever**
Classical Swine Fever

- Endemic in most sub-Saharan Africa
  - Reported in Europe, Iberian Peninsula, and Sardinia
  - Now eradicated from four South American and Caribbean countries

- Hosts
  - Pigs
  - Wart hogs, Bush pigs (often show no symptoms)
  - American wild pigs

Appendix A: Slides 61-63
## African Swine Fever

<td>Soft ticks are the main method of virus maintenance</td>
</tr>
</tbody>
</table>

**Incubation period is 5–15 days**

### On-Farm Disease Recognition

#### Acute form (highly virulent virus)
- Fever (104.9–107.6°F)
- Reddening of the skin (visible in white pigs)
  - Tips of ears, tail, limbs and underside of chest and abdomen
- Lack of appetite
- Lassitude
- Cyanosis
- Incoordination within 24–48 hours of death
- Increased pulse and respiratory rate
- Vomiting
- Diarrhea (sometimes bloody)
- Eye discharges
- Death within a few days
- Abortions
- Survivors are carriers for life
- In domestic swine, mortality approaches 100%

#### Sub acute form (moderately virulent virus)
- Less intense symptoms
- Duration of illness is 5–30 days
- Abortion
- Mortality rate is lower
  - Various widely
  - Between 30–70%

#### Chronic form
- Various signs: weight loss, irregular peaks of temperature, respiratory signs, necroses in areas of skin, chronic skin ulcers, arthritis
- Pericarditis
- Adhesions of lungs
- Swelling over joints
- Develops over months
- Low mortality

---

Appendix A: Slides 64-66
On-Farm Disease Recognition

Skin of pig severely inflamed, reddened
Depressed piglet also with signs of erythema

Diseases with Similar Symptoms

- Classical swine fever
  - It is not possible to differentiate African and Classical Swine fever by clinical or post-mortem exam; must send samples to laboratory
- Erysipelas
- Salmonellosis
- Pasteurellosis
- All septicemic conditions

Recognition of Specific Diseases

Foot and Mouth Disease
Heartwater
African Horse Sickness
Venezuelan Equine Encephalomyelitis
Rift Valley Fever
Exotic Newcastle Disease
Highly Pathogenic Avian Influenza
African Swine Fever

Classical Swine Fever
Classical Swine Fever

- Occurs in much of Asia, Central and South America, and parts of Europe and Africa
  - Many countries free of the disease
- Hosts
  - Pigs and wild boar are the only natural reservoir
- Transmission
  - Direct contact between animals: Secretions, excretions, semen and/or blood
  - Spread by farm visitors, veterinarians, pig traders
  - Indirect contact through premises, implements, vehicles, clothes, instruments and needles
  - Insufficiently cooked waste food fed to pigs
  - Transplacental infection to unborn piglets

Sources of Infection

- Incubation period is 2–14 days

Sources of virus
- Blood, all tissues, secretions and excretions of sick and dead animals
- Congenitally infected piglets persistently viremic, may shed virus for months
- Infection routes are
  - Ingestion
  - Contact with the conjunctiva, mucous membranes, skin abrasions
  - Insemination

On-Farm Disease Recognition

- Acute form
  - Fever (105.8° F)
  - Lack of appetite
  - Lethargy
  - Multifocal hyperemia and hemorrhagic lesions of the skin and conjunctiva
  - Cyanosis of the skin especially the extremities
  - Transient constipation followed by diarrhea
  - Vomiting (occasionally)
  - Dyspnea, coughing
  - Ataxia, paresis and convulsion
  - Pigs huddle together
  - Death occurs 5–15 days after onset of illness
  - Mortality in young pigs can approach 100%
On-Farm Disease Recognition

Classical Swine Fever

Chronic form
- Dullness
- Capricious appetite
- Fever
- Diarrhea for up to one month
- Apparent recovery with eventual relapse then death

Congenital form
- Congenital tremor
- Weakness
- Runting, poor growth over a period of weeks or months leading to death
- Clinically normal, but persistently viremic pigs, with no antibody response

Mild form
- Transient fever
- Lack of appetite
- Fetal death, mummification, resorption, still birth
- Birth of live, congenitally affected piglets
- Abortion (rare)

### Disease with Similar Symptoms

- African Swine fever
  - Indistinguishable clinicopathologically, must send samples to laboratory
- Bovine viral diarrhea virus infection
- Salmonellosis
- Erysipelas
- Acute pasteurellosis
- Other viral encephalomyelitis
- Streptococcosis
- Leptospirosis
- Coumarin poisoning

### Diagnosing, Controlling, and Reporting FADs

Appendix A: Slides 73-75
A Difficult Diagnosis

- FADs often resemble many other diseases
- Attention to clinical signs and ruling out other diseases is often the first step to making an accurate diagnosis
- Some clinical signs are more suggestive of a FAD
  - Vesicles/blisters on the mouth, nose and feet of ruminants or swine
  - Sudden death in livestock
  - Abortions in otherwise healthy and well vaccinated herds

Reporting a Suspected FAD

- Cases of suspected FADs must be reported to federal and state authorities
- Federal
  - USDA APHIS District Offices (See Key Resources)
- State
  - State Veterinarian (See Key Resources)
- Federal and State authorities work together to obtain appropriate samples for FAD diagnosis
  - Samples are handled with special processing and handling
- Movement of people and animals should be restricted to limit the potential spread of infection

Controlling FADs

- Maintain good biosecurity practices on farms
- Insect, rodent and parasite control
- Up-to-date vaccination schedule
- Isolate and quarantine new animals
- Limit contact between animals of differing species
- Limit contact between livestock and wildlife
